Smart Agriculture System based on IOT

Introduction:

This project is build to reduce the efforts of farmers by developing a smart agriculture system with the help of IBM cloud IOT platform service, IBM IOT sensor and Node-red service. By this system farmer can operate the motor that is ON/OFF based on moisture level even when he is far away from the farm.

Project Requirements:

- IBM cloud Watson IOT platform service
- Node-Red service
- Python IDLE
- IBM IOT simulator

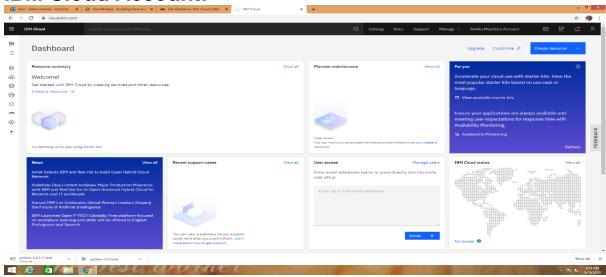

Methodology:

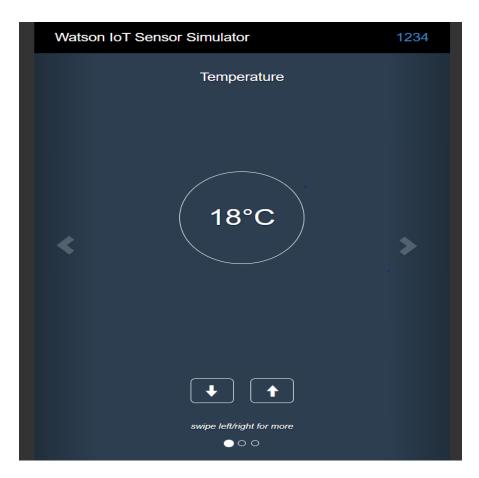

Smart Agriculture System is constructed by first creating IBM cloud account and accessing Watson service in it. A device is created so that it receives the data which is sent by the IBM IOT simulator. IBM IOT simulator contains the data of parameters like temperature, humidity and soil moisture of a particular farm. Then the data which is received by the IBM cloud is integrated to the Node-Red. A web application is build in

Node-Red by using nodes in it to give user interface according to the data given by IBM IOT sensor. Weather API which is an open source gives us the information of weather of a particular region which is mentioned is also integrated in to the Node-Red. Finally a python code written in python IDLE to subscribe to IBM IOT platform and get the commands when the motor is ON/OFF.

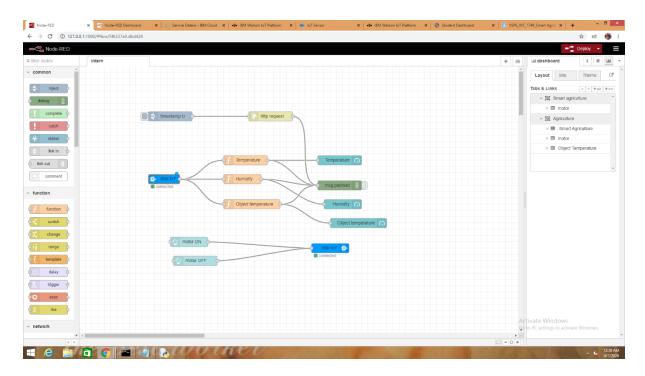

IBM Cloud Account:

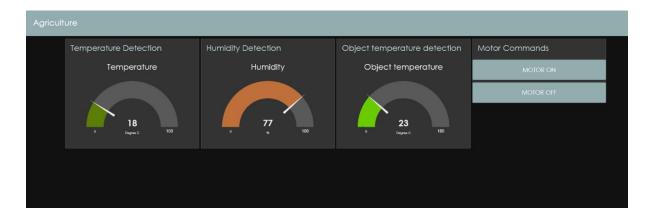

IBM IOT simulator

Node -Red:

User Interface:

Python Code:

```
import time
import sys
import ibmiotf.application # to install pip install ibmiotf
import ibmiotf.device
#Provide your IBM Watson Device Credentials
organization = "sn7xq0" #replace the ORG ID
deviceType = "smartdevice"#replace the Device type
deviceId = "123456"#replace Device ID
authMethod = "token"
authToken = "9441718473" #Replace the authtoken
def myCommandCallback(cmd): # function for Callback
print("Command received: %s" % cmd.data)
if cmd.data['command']=='motorON':
print("MOTOR ON IS RECEIVED")
elif cmd.data['command']=='motorOFF':
print("MOTOR OFF IS RECEIVED")
if cmd.command == "setInterval":
if 'interval' not in cmd.data:
print("Error - command is missing required information: 'interval'")
else:
interval = cmd.data['interval']
elif cmd.command == "print":
if 'message' not in cmd.data:
print("Error - command is missing required information: 'message'")
else:
output=cmd.data['message']
print(output)
try:
deviceOptions = {"org": organization, "type": deviceType, "id": deviceId,
"auth-method": authMethod, "auth-token": authToken}
deviceCli = ibmiotf.device.Client(deviceOptions)
#.....
except Exception as e:
print("Caught exception connecting device: %s" % str(e))
sys.exit()
```

Connect and send a datapoint "hello" with value "world" into the cloud as an event of type "greeting" 10 times deviceCli.connect()

while True:

deviceCli.commandCallback = myCommandCallback

Disconnect the device and application from the cloud deviceCli.disconnect()

Result:

This 'Smart Agriculture System based on IOT' enabled farmer to reduce his daily tasks and to save his time instead of going to the farm daily. The motor commands are also received when it is ON/OFF.
